This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (currently amended) In a time division multiple access (TDMA) system, a method comprising the steps:

at a subscriber:

listening to an assigned channel and an alternate channel;

performing the step of listening to the alternate channel until a location of reverse channel signaling is determined for the assigned channel;

obtaining a fixed periodic rate for reverse channel signaling;

transmitting information on the assigned channel; and

based on the fixed periodic rate, selectively listening to the alternate channel to receive reverse channel signaling.

- 2. (withdrawn) The method of claim 1 wherein the step of obtaining comprises listening to the assigned channel.
- 3. (withdrawn) The method of claim 1 wherein the step of obtaining comprises listening to the alternate channel.
- 4. (original) The method of claim 1 wherein the step of obtaining comprises retrieving the fixed periodic rate from memory, wherein the fixed periodic rate is programmed into memory a priori.

P.5/8

5. (previously presented) The method of claim 1 further comprising at a base repeater:

selecting a fixed periodic rate for reverse channel signaling;

receiving a burst, wherein the burst belongs to a superframe, and the superframe comprises a plurality of bursts;

determining that at least one burst in the superframe will collide with reverse channel signaling;

buffering the received burst; and transmitting the buffered burst at a subsequent time.

- 6. (original) The method of claim 5 wherein the burst is a voice burst.
- 7. The method of claim 5 wherein the burst is a data burst. (original)
- 8. (original) The method of claim 5 wherein the step of selecting is performed dynamically.
- 9. (original) The method of claim 5 wherein the step of selecting comprises retrieving the fixed periodic rate from memory, and wherein the fixed periodic rate is programmed into memory a priori.
- 10. The method of claim 5 wherein the step of transmitting comprises (original) delaying the buffered burst by one frame.
- 11. (currently amended) In a time division multiple access (TDMA) system, a method comprising the steps:

selecting a fixed periodic rate for reverse channel signaling for a first channel; and transmitting reverse channel signaling at the fixed periodic rate to a transmitting subscriber assigned to the first channel,

wherein the reverse channel signaling is transmitted in a shared signaling field on a second channel on an outbound path while the second channel supports a first call and the first channel supports a second call.

- 12. (original) The method of claim 11 wherein the TDMA system comprises an aligned slotting structure.
- 13. (withdrawn) The method of claim 12 wherein the transmitting subscriber is assigned to transmit on a first channel on an inbound path and to receive reverse channel signaling on a second channel on an outbound path.
- 14. (original) The method of claim 11 wherein the TDMA system comprises an offset slotting structure.
- 15. (withdrawn) The method of claim 14 wherein the transmitting-subscriber is assigned to transmit on a first-channel on an inbound path and to receive reverse channel signaling on the first channel of an outbound path.
- 16. (currently amended) The method of claim 11 wherein the reverse channel signaling is transmitted in a shared signaling field, and wherein the shared signaling field carries one of reverse channel signaling, synchronization and embedded signaling.
